

Multi-start verification: bounded L-BFGS-B from random initial points
Every interior run converges to the same critical point, even at moderate noise where most starts hit the bound.

Synthetic single-covariate, $\varepsilon = \delta = 0.10$, $n = 1000$

Breast cancer (4 predictors), $\varepsilon = \delta = 0.10$

Breast cancer, moderate noise $\varepsilon = \delta = 0.20$
